

READING PASSAGE 1

You should spend about 20 minutes on Questions 1-15 which are based on Reading Passage 1 below

A spark, a flint: How fire leapt to life

The control of fire was the first and perhaps greatest of humanity's steps towards a life-enhancing technology

To early man, fire was a divine gift randomly delivered in the form of lightning, forest fire or burning lava. Unable to make flame for themselves, the earliest peoples probabh stored fire by keeping slow burning logs alight or by carrying charcoal in pots.

How and where man learnt how to produce flame at will is unknown. It was probably a secondary invention, accidentally made during tool-making operations with wood or stone. Studies of primitive societies suggest that the earliest method of making fire was through friction. European peasants would insert a wooden drill in a round hole and rotate it briskly between their palms This process could be speeded up by wrapping a cord around the drill and pulling on each end.

The Ancient Greeks used lenses or concave mirrors to concentrate the sun's rays and burning

glasses were also used by Mexican Aztecs and the Chinese.

Percussion methods of fire-lighting date back to Paleolithic times, when some Stone Age tool-makers discovered that chipping flints produced sparks. The technique became more efficient after the discovery of iron, about 5000 years

ago In Arctic North America, the Eskimos produced a slow-burning spark by striking quartz against iron pyrites, a compound that contains sulphur. The Chinese lit their fires by striking porcelain with bamboo. In Europe, the combination of steel, flint and tinder remained the main method of fire-lighting until the mid 19th century.

Fire-lighting was revolutionised by the discovery of phosphorus, isolated in 1669 by a German alchemist trying to transmute silver into gold. Impressed by the element's combustibility, several 17th century chemists used it to manufacture fire-lighting devices, but the results were dangerously inflammable. With phosphorus costing the

equivalent of several hundred pounds per ounce, the first matches were expensive.

The quest for a practical match really began after 1781 when a group of French chemists came up with the *Phosphoric Candle* or *Ethereal Match*, a sealed glass tube containing a twist of paper tipped with phosphorus. When the tube was broken, air rushed in, causing the phosphorus to self-combust. An even more hazardous device, popular in America, was the *Instantaneous Light Box* — a bottle filled with sulphuric acid into which splints treated with chemicals were dipped.

The first matches resembling those used today were made in 1827 by John Walker, an English pharmacist who borrowed the formula from a military rocket-maker called Congreve. Costing a shilling a box, *Congreves* were splints coated with sulphur and tipped with potassium chlorate. To light them, the user drew them quickly through folded glass paper.

Walker never patented his invention, and three years later it was copied by a Samuel Jones, who marketed his product as *Lucifers*. About the same time, a French chemistry student called Charles Sauria produced the first “strike-anywhere” match by substituting white phosphorus for the potassium chlorate in the Walker formula. However, since white phosphorus is a deadly poison, from 1845 match-makers exposed to its fumes succumbed to necrosis, a disease that eats away jaw-bones. It wasn't until 1906 that the substance was eventually banned.

That was 62 years after a Swedish chemist called Pasch had discovered non-toxic red or amorphous phosphorus, a development exploited commercially by Pasch's compatriot J E Lundstrom in 1885. Lundstrom's safety matches were safe because the red phosphorus was non-toxic; it was painted on to the striking surface instead of the match tip, which contained potassium chlorate with a relatively high ignition temperature of 182 degrees centigrade.

America lagged behind Europe in match technology and safety standards. It wasn't until 1900 that the Diamond Match Company bought a French patent for safety matches — but the formula did not work properly in the different climatic conditions prevailing in America and it was another 11 years before scientists finally adapted the French patent for the US.

The Americans, however, can claim several “firsts” in match technology and marketing. In 1892 the Diamond Match Company pioneered book matches. The innovation didn't catch on until after 1896, when a brewery had the novel idea of advertising its product in match books. Today book matches are the most widely used type in the US, with 90 percent handed out free by hotels, restaurants and others.

Other American innovations include an anti-afterglow solution to prevent the match from smouldering after it has been blown out; and the waterproof match, which lights after eight hours in water.

Questions 1-8

Complete the summary below. Choose your answers from the box at the bottom of the page and write them in boxes 1-8 on your answer sheet.

NB There are more words than spaces so you will not use them all. You may use any of the words more than once.

EARLY FIRE-LIGHTING METHODS

Primitive societies saw fire as a ... (Example) ... gift. Answer heavenly

They tried to ... (1) ... burning logs or charcoal ... (2) ... that they could create fire themselves. It is suspected that the first man-made flames were produced by ... (3) ...

The very first fire-lighting methods involved the creation of ... (4) ... by, for example, rapidly ... (5) ... a wooden stick in a round hole. The use of ... (6) ... or persistent chipping was also widespread in Europe and among other peoples such as the Chinese and ... (7) European practice of this method continued until the 1850s ... (8) ... the discovery of phosphorus some years earlier.

- | List of Words | | |
|---------------|----------|-----------|
| Mexicans | random | rotating |
| despite | preserve | realising |
| sunlight | lacking | heavenly |
| percussion | chance | friction |
| unaware | without | make |
| heating | Eskimos | surprised |
| until | smoke | |

Questions 9-15

Look at the following notes that have been made about the matches described in Reading Passage 1. Decide which type of match (**A-H**) corresponds with each description and write your answers in boxes 9-15 on your answer sheet.

NB There are more matches than descriptions so you will not use them all. You may use any match more than once.

<i>Example</i>	<i>Answer</i>
could be lit after soaking in water	H

NOTES

- 9** made using a less poisonous type of phosphorus
- 10** identical to a previous type of match
- 11** caused a deadly illness
- 12** first to look like modern matches
- 13** first matches used for advertising
- 14** relied on an airtight glass container
- 15** made with the help of an army design

Types of Matches	
A	the Ethereal Match
B	the Instantaneous Lightbox
C	Congreves
D	Lucifers
E	the first strike-anywhere match
F	Lundstrom's safety match
G	book matches
H	waterproof matches

READING PASSAGE 2

You should spend about 20 minutes on **Questions 16-28** which are based on Reading Passage 2 below.

Zoo conservation programmes

One of London Zoo's recent advertisements caused me some irritation, so patently did it distort reality. Headlined "Without zoos you might as well tell these animals to get stuffed", it was bordered with illustrations of several endangered species and went on to extol the myth that without zoos like London Zoo these animals "will almost certainly disappear forever". With the zoo world's rather mediocre record on conservation, one might be forgiven for being slightly sceptical about such an advertisement.

Zoos were originally created as places of entertainment, and their suggested involvement with conservation didn't seriously arise until about 30 years ago, when the Zoological Society of London held the first formal international meeting on the subject. Eight years later, a series of world conferences took place, entitled "The Breeding of Endangered Species", and from this point onwards conservation became the zoo community's buzzword. This commitment has now been clearly defined in The World Zoo Conservation Strategy (WZCS, September 1993), which although an important and welcome document does seem to be based on an unrealistic optimism about the nature of the zoo industry.

The WZCS estimates that there are about 10,000 zoos in the world, of which around 1,000 represent a core of quality collections capable of participating in co-ordinated conservation programmes. This is probably the document's first failing, as I believe that 10,000 is a serious underestimate of the total number of places masquerading as zoological establishments. Of course it is difficult to get accurate data but, to put the issue into perspective, I have found that, in a year of working in Eastern Europe, I discover fresh zoos on almost a weekly basis.

The second flaw in the reasoning of the WZCS document is the naive faith it places in its 1,000 core zoos. One would assume that the calibre of these institutions would have been carefully examined, but it appears that the criterion for inclusion on this select list might merely be that the zoo is a member of a zoo federation or association. This might be a *good starting point, working on* the premise that members must meet certain standards, but again the facts don't support the theory. The greatly respected American Association of Zoological Parks and Aquariums (AAZPA) has had extremely dubious members, and in the UK the Federation of Zoological Gardens of Great Britain and Ireland has

occasionally had members that have been roundly censured in the national press. These include Robin Hill Adventure Park on the Isle of Wight, which many considered the most notorious collection of animals in the country. This establishment, which for years was protected by the Isle's local council (which viewed it as a tourist amenity), was finally closed down following a damning report by a veterinary inspector appointed under the terms of the Zoo Licensing Act 1981. As it was always a collection of dubious repute, one is obliged to reflect upon the standards that the Zoo Federation sets when granting membership. The situation is even worse in developing countries where little money is available for redevelopment and it is hard to see a way of incorporating collections into the overall scheme of the WZCS.

Even assuming that the WZCS's 1,000 core zoos are all of a high standard complete with scientific staff and research facilities, trained and dedicated keepers, accommodation that permits normal or natural behaviour, and a policy of co-operating fully with one another what might be the potential for conservation? Colin Tudge, author of *Last Animals at the Zoo* (Oxford University Press, 1992), argues that "if the world's zoos worked together in co-operative breeding programmes, then even without further expansion they could save around 2,000 species of endangered land vertebrates'. This seems an extremely optimistic proposition from a man who must be aware of the failings and weaknesses of the zoo industry the man who, when a member of the council of London Zoo, had to persuade the zoo to devote more of its activities to conservation. Moreover, where are the facts to support such optimism?

Today approximately 16 species might be said to have been "saved" by captive breeding programmes, although a number of these can hardly be looked upon as resounding successes. Beyond that, about a further 20 species are being seriously considered for zoo conservation programmes. Given that the international conference at London Zoo was held 30 years ago, this is pretty slow progress, and a long way off Tudge's target of 2,000.

Practice Test 1

Questions 16-22

Do the following statements agree with the views of the writer in Reading Passage 2?
In boxes 16-22 write

- YES** if the statement agrees with the writer
NO if the statement contradicts the writer
NOT GIVEN if it is impossible to say what the writer thinks about this

<i>Example</i>	<i>Answer</i>
London Zoo's advertisements are poorly presented.	NOT GIVEN

- 16 London Zoo's advertisements are dishonest.
17 Zoos made an insignificant contribution to conservation up until 30 years ago.
18 The WZCS document is not known in Eastern Europe.
19 Zoos in the **WZCS** select list were carefully inspected.
20 No-one knew how the animals were being treated at Robin Hill Adventure Park.
21 Colin Tudge was dissatisfied with the treatment of animals at London Zoo.
22 The number of successful zoo conservation programmes is unsatisfactory.

Questions 23-25

Choose the appropriate letters **A-D** and write them in boxes 23-25 on your answer sheet.

- 23 What were the objectives of the WZCS document?
- A** to improve the calibre of zoos world-wide
 - B** to identify zoos suitable for conservation practice
 - C** to provide funds for zoos in underdeveloped countries
 - D** to list the endangered species of the world
- 24 Why does the writer refer to Robin Hill Adventure Park?
- A** to support the Isle of Wight local council
 - B** to criticise the 1981 Zoo Licensing Act
 - C** to illustrate a weakness in the WZCS document
 - D** to exemplify the standards in AAZPA zoos

- 25 What word best describes the writer's response to Colin Tudges' prediction on captive breeding programmes?
- A disbelieving
 - B impartial
 - C prejudiced
 - D accepting

Questions 26-28

The writer mentions a number of factors which lead him to doubt the value of the WZCS document. Which **THREE** of the following factors are mentioned? Write your answers (A-F) in boxes 26-28 on your answer sheet.

List of Factors

- A the number of unregistered zoos in the world
- B the lack of money in developing countries
- C the actions of the Isle of Wight local council
- D the failure of the **WZCS** to examine the standards of the "core zoos"
- E the unrealistic aim of the **WZCS** in view of the number of species "saved" to date
- F the policies of **WZCS** zoo managers

READING PASSAGE 3

You should spend about 20 minutes on **Questions 29-40** which are based on Reading Passage 3 below.

ARCHITECTURE - Reaching for the Sky

Architecture is the art and science of designing buildings and structures. A building reflects the scientific and technological achievements of the age as well as the ideas and aspirations of the designer and client. The appearance of individual buildings, however, is often controversial.

The use of an architectural style cannot be said to start or finish on a specific date.

Neither is it possible to say exactly what characterises a particular movement. But the origins of what is now generally known as modern architecture can be traced back to the social and technological changes of the 18th and 19th centuries.

Instead of using timber, stone and traditional building techniques, architects began to explore ways of creating buildings by using the latest technology and materials such as steel, glass and concrete strengthened steel bars, known as reinforced concrete. Technological advances also helped bring about the decline of rural industries and an increase in urban populations as people moved to the towns to work in the new factories. Such rapid and uncontrolled growth helped to turn parts of cities into slums.

By the 1920s architects throughout Europe were reacting against the

conditions created by industrialisation. A new style of architecture emerged to reflect more idealistic notions for the future. It was made possible by new materials and construction techniques and was known as Modernism.

By the 1930s many buildings emerging from this movement were designed in the International Style. This was largely characterised by the bold use of new materials and simple, geometric forms, often with white walls supported by stilt-like pillars. These were stripped of unnecessary decoration that would detract from their primary purpose — to be used or lived in.

Walter Gropius, Charles Jeanneret (better known as Le Corbusier) and Ludwig Mies van der Rohe were among the most influential of the many architects who contributed to the development of Modernism in the first half of the century. But the economic depression of the 1930s and the second world war (1939-45) prevented their ideas from being widely realised until the economic conditions improved and war-torn cities had to be rebuilt. By the 1950s, the International Style had developed into a universal approach to building, which standardised the appearance of new buildings in cities across the world.

Unfortunately, this Modernist interest in geometric simplicity and function became exploited for profit. The rediscovery of

quick-and-easy-to-handle reinforced concrete and an improved ability to prefabricate building sections meant that builders could meet the budgets of commissioning authorities and handle a renewed demand for development quickly and cheaply. But this led to many badly designed buildings, which discredited the original aims of Modernism.

Influenced by Le Corbusier's ideas on town planning, every large British city built multi-storey housing estates in the 1960s. Mass-produced, low-cost high-rises seemed to offer a solution to the problem of housing a growing inner-city population. But far from meeting human needs, the new estates often proved to be windswept deserts lacking essential social facilities and services. Many of these buildings were poorly designed and constructed and have since been demolished.

By the 1970s, a new respect for the place of buildings within the existing townscape arose. Preserving historic buildings or keeping only their facades (or fronts) grew common. Architects also began to make more use of building styles and materials that were traditional to the area. The architectural style usually referred to as High Tech was also emerging. It

celebrated scientific and engineering achievements by openly parading the sophisticated techniques used in construction. Such buildings are commonly made of metal and glass; examples are Stansted airport and the Lloyd's building in London.

Disillusionment at the failure of many of the poor imitations of Modernist architecture led to interest in various styles and ideas from the past and present. By the 1980s the coexistence of

different styles of architecture in the same building became known as Post Modern. Other architects looked back to the classical tradition. The trend in architecture now favours smaller scale building design that reflects a growing public awareness of environmental issues such as energy efficiency. Like the Modernists, people today recognise that a well designed environment improves the quality of life but is not necessarily achieved by adopting one well defined style of architecture.

Twentieth century architecture will mainly be remembered for its tall buildings. They have been made possible by the development of light steel frames and safe passenger lifts. They originated in the US over a century ago to help meet the demand for more economical use of land. As construction techniques improved, the skyscraper became a reality.

Ruth Coleman

Questions 29-35

Complete the table below using information from Reading Passage 3. Write **NO MORE THAN THREE WORDS** for each answer. Write your answers in boxes 29-35 on your answer sheet.

PERIOD	STYLE OF PERIOD	BUILDING MATERIALS	CHARACTERISTICS
Before 18th century	<i>Example</i> traditional	... (29) ...	
1920s	introduction of ... (30) ...	steel, glass and concrete	exploration of latest technology
1930s - 1950s	... (31) ...		geometric forms
1960s	decline of Modernism	pre-fabricated sections	... (32) ...
1970s	end of Modernist era	traditional materials	... (33) ... of historic buildings
1970s	beginning of ... (34) ... era	metal and glass	sophisticated techniques paraded
1980s	Post-Modernism		... (35) ...

Practice Test 1

Questions 36-40

Reading Passage 3 describes a number of cause and effect relationships. Match each Cause (36-40) in List A, with its Effect (A-H) in List B.

Write your answers (A-H) in boxes 36 40 on your answer sheet.

NB There are more effects in List B than you will need, so you will not use all of them. You may use any effect more than once if you wish.

<i>List A</i> CAUSES	<i>List B</i> EFFECTS
<p>36 A rapid movement of people from rural areas to cities is triggered by technological advance.</p> <p>37 Buildings become simple and functional.</p> <p>38 An economic depression and the second world war hit Europe.</p> <p>39 Multi-storey housing estates are built according to contemporary ideas on town planning.</p> <p>40 Less land must be used for building.</p>	<p>A The quality of life is improved.</p> <p>B Architecture reflects the age.</p> <p>C A number of these have been knocked down.</p> <p>D Light steel frames and lifts are developed.</p> <p>E Historical buildings are preserved.</p> <p>F All decoration is removed.</p> <p>G Parts of cities become slums.</p> <p>H Modernist ideas cannot be put into practice until the second half of the 20th century.</p>

PRACTICE TEST 1

READING

READING PASSAGE 1 *A spark, a flint: How fire leapt to life*

Questions	Task	Skills tested
1-8	Gap fill summary	<ul style="list-style-type: none"> • skimming for information • detailed understanding of a section of text • ability to paraphrase/re-word original text
9-15	Matching (items to descriptions)	<ul style="list-style-type: none"> • skimming for specific information • understanding description/characteristics • understanding paraphrase

Questions 1-8

Question	Answer
1	preserve
2	unaware
3	chance
4	friction
5	rotating
6	percussion
7	Eskimos
8	despite

Questions 9-15

Suggested approach

- Read the task rubric carefully. In this task you have to decide which match is being described in each question.
- Decide what information is best to skim for in the passage: the *type of match* or the *description*. In this question it is best to skim for the types of match as these are names, some of which are in italics, they are easier for you to pick out.
- Skim through the text until you find match A, the *Ethereal Match*.
- Read that section of the text and underline any important features of this match.
- Read through the descriptions and write A next to any that fit this type of match.

If you think there is more than one possible description for the match, note A next to both. (The rubric states that you may use any match more than once.)

- Towards the top of the second page of the text it states that the *Ethereal Match* consisted of a “sealed glass tube”, so A is the answer to question 14. Note that the description is expressed differently from the text. Sometimes you have to match the meaning rather than the words.
- If you think none of the descriptions fits this type of match, go on to the next the rubric also states that there are not enough descriptions to fit all the matches.

Question	Answer	Location of answer in text
9	F	“... the red phosphorus was non toxic”
10	D	“... three years later it was copied ...”
11	E	“... since white phosphorus is a deadly poison ...”
12	C	“The first matches resembling those used today ...”
13	G	“... a brewery had the novel idea of advertising ...”
14	A	“... a sealed glass tube ...”
15	C	“... borrowed the formula from a military rocket-maker ...”

Practice Test 1

READING PASSAGE 2 Zoo conservation programmes

Questions	Task	Skills tested
16-22	Yes, No, Not Given	<ul style="list-style-type: none"> • skimming for detailed information • identifying attitude and opinion • understanding gist and paraphrase
23-25	Multiple choice	<ul style="list-style-type: none"> • skimming for factual information • identifying main and supporting points • understanding attitude
26-28	Selecting factors	<ul style="list-style-type: none"> • skimming/scanning for specific information • identifying main ideas • understanding paraphrase and inference

Questions 16-25

Question	Answer
16	YES
17	YES
18	NOT GIVEN
19	NO
20	NO
21	NOT GIVEN
22	YES
23	B
24	C
25	A

Questions 26-28

Suggested approach

- Read the task rubric carefully. Only *three* of the factors in the list are correct. The correct factors explain why the author *doubts the value* of the WZCS document.
- Scan the text and mark the section that discusses the accuracy/value of the WZCS document. This is from the third paragraph onwards.
- Read through the list of factors to familiarise yourself with it.
- Begin reading the third paragraph more carefully, looking for phrases that signal that the writer is going to discuss something that is wrong with the document. The first signal is:

'This is probably the document's *first failing ...*'
 You can infer from what the writer then states, that **A** is one of the correct factors.

- Re-read the list of factors from **B-F**.
- Continue reading the text, looking for other signals.
- Select the two other correct factors.

Remember that if you put more than one factor beside each question number on your answer sheet, you will not get any marks. However the three correct answers can be written down in any order.

Question	Answer	Location of answer in text
26	A	"... 10,000 is a serious underestimate of the total number of places masquerading as zoological establishments."
27	D	"One would assume that the calibre of these institutions would have been carefully examined but ..."
28	E	The last two paragraphs of the text but in particular: "Today approximately 16 species might be said to have been "saved" by captive breeding programmes, although a number of these can hardly be looked upon as resounding successes."

READING PASSAGE 3 Architecture

Questions	Task	Skills tested
29-35	Completing a table	<ul style="list-style-type: none"> • following a chronological account • skimming for specific information • noting main ideas
36-40	Matching (causes to effects)	<ul style="list-style-type: none"> • skimming/scanning for information • understanding cause and effect relationships • understanding paraphrase

Questions 29-35

Question	Answer
29	timber and stone
30	Modernism
31	International style
32	badly designed buildings//multi-storey housing//mass-produced, low-cost high-rises
33	preservation
34	High-Tech
35	co-existence of styles//different styles together//styles mixed

Questions 36-40

Suggested approach

- Read the task rubric carefully. You have to decide which *effect* arose from each *cause*.
- Decide which list you should work from. In this case it is better to work from List A as you must find an effect in List B for every question. The causes also come first chronologically in the cause/effect relationship: List B contains *results* of List A.
- Read through List B to familiarise yourself with it.
- Read item 36.
- Skim through the passage until you locate the information in the text.
- Read this section of the text in detail noting any *effects* of 36.
- Read through List B again.
- Select the effect of question 36. If you think there is more than one effect, mark both and come back to this item later. But remember that

only one answer is correct.

- In the third paragraph it states that the increase in urban populations “helped to turn parts of cities into slums”. So the answer to question 36 is G.
- Repeat this procedure with items 37-40.

Question	Answer	Location of answer in text
36	G	“Such rapid and uncontrolled growth helped to turn parts of cities into slums.”
37	F	“These were stripped of unnecessary decoration that would detract from their primary purpose — to be used or lived in.”
38	H	“But the economic depression prevented their ideas from being widely realised until the economic conditions improved ...”
39	C	“Many of these buildings ... have since been demolished.”
40	D	“They originated in the US ... to help meet the demand for more economical use of land.”
